

Exercise 6 – Interactive Web Application

Learning objectives: Apply and learn the basic principles of interactive web applications

Remember, our project is:

Browser-Based TicTacToe for 2 Players

A detailed description can be found in exercise 1. In addition, use the documentation created in the previous exercises as a basis for the following tasks.

Again, This exercise may require you to do some research on technologies you have not encountered before. That is part of a software architect's job!

Part 1 – Architectural Decisions on Taking Turns

Our users/players want to actually play the game. To this end, each player must be able to draw/place their respective shape onto the playing field.

How are you going to do this? Make an architectural decision and document it as an ADR in your `"adr5.md"`-file.

Evaluate at least two alternative technologies/approaches on how players could make their turns and how this could be implemented.

Part 2 – Implement the Ability to Take Turns

Implement the users taking turns and drawing/placing their shapes on the playing field. When you are done, your TicTacToe should be able to do the following:

1. Each player should be able to place/draw their shape onto the field when it is their turn
2. A change to the field should be visible to both player (meaning, the other user's view should update as well)
3. A player should only be able to place their shape, when it is their turn
4. After placing the shape, the current player's turn ends and the other player's turn starts
5. Shapes can only be placed on empty spaces

Note: You do not yet have to evaluate the winner. We'll do that in a future exercise.
