

Exercise 3 – TicTacToe Architectural Decisions

Learning objectives: Apply and learn the impact of architectural decisions

Remember, our project is:

Browser-Based TicTacToe for 2 Players

A detailed description can be found in exercise 1. In addition, use the requirements document and quality attributes document as a basis for the following tasks.

In your Git repository's `docs` directory: Create a file named "`adrs.md`". Write the results of the following tasks into this file. Commit and push it to GitLab once you are done.

This exercise may require you to do some research on technologies you have not encountered before. That is part of a software architect's job!

Part 1 – Primary ADRs

Using the ADR structure from the lecture. Make the following three decisions and create architectural decision records on them. Make sure to evaluate every one of your decisions against your quality goals from exercise 2.

1. Programming Language: What programming language are you going to use for implementing TicTacToe?
2. Website type: What type of website are you going to write (e.g., Single-Page-Application with dynamic calls, Server-Side Templating, ...)
3. Web Library / Framework: What web library / framework are you going to use for implementing the TicTacToe frontend/backend?

Part 2 – Additional ADRs

Create at least one additional ADR for a technological question that has come up during your discussions.
